What is an  
audit?

# Annual statement

True and fair representation

Performance and developments

The public trusts us

## Internal inspections (Quality Performance Reviews or QPR)

QPR is performed under the supervision of the Compliance Office with a team of Dutch (local) and non-Dutch (non-local) reviewers at partner and senior-manager level. Engagements are rated against KPMG's global quality baselines. These baselines and ratings differ between Audit and Advisory. Audit engagements reviewed are rated Satisfactory, Performance Improvement Necessary or Unsatisfactory depending on the nature and severity of findings. Advisory engagements reviewed receive two ratings – one for set up and one for execution. Ratings are Green, Yellow or Red. Green and Yellow ratings are awarded when engagements are substantially compliant with KPMG standards. The QPR process is overseen by a non-local lead reviewer. A centrally led international Quality Performance Review team carries out a number of the annual QPR reviews at various KPMG member firms, especially for audits of listed and related entities.

During the year under review, 59 Audit partners (FY 2016/17: 52) and 55 Advisory partners/directors (FY 2016/17: 72) were subject to internal quality performance reviews.

### Audit

In Audit 68% of the engagements received a Satisfactory rating (FY 2016/17: 65%). Although our target of 75% Satisfactory scores was not yet achieved, we have made significant progress on decreasing the number of less than satisfactory scores. We launched a quality coaching effort on auditing of revenue (one

Figure 2. QPR scores Audit partners/directors

of the most common areas with QPR findings) to help engagement teams real-time rather than after the fact. We saw a decrease in revenue related findings indicating that team coaching appears to be a driver for audit quality. We will test this hypothesis next year by expanding this type of quality coaching to other areas with QPR findings.

In general, employees are satisfied with daily training on the job with 87% positive scores in the annual Global People Survey.

QPR findings have been communicated to Audit professionals during KPMG's annual professional update sessions as well as through virtual classrooms. We subsequently performed root cause analyses on QPR findings per engagement to ensure we addressed likely organisational issues too.

# Simplified network

Boersma, Marcel, et al. "Financial statement networks: an application of network theory in audit." *The Journal of Network Theory in Finance* 4 (2018).

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Audit insights

## **Auditors can use the network for risk assessment by:**

- Comparing their understanding of a client's financial structure with the network structure

## **Auditors can use the network to obtain substantive evidence by:**

- A way to assess the consistency between financial flows for audit evidence

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Network statistics

# Understanding the networks

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

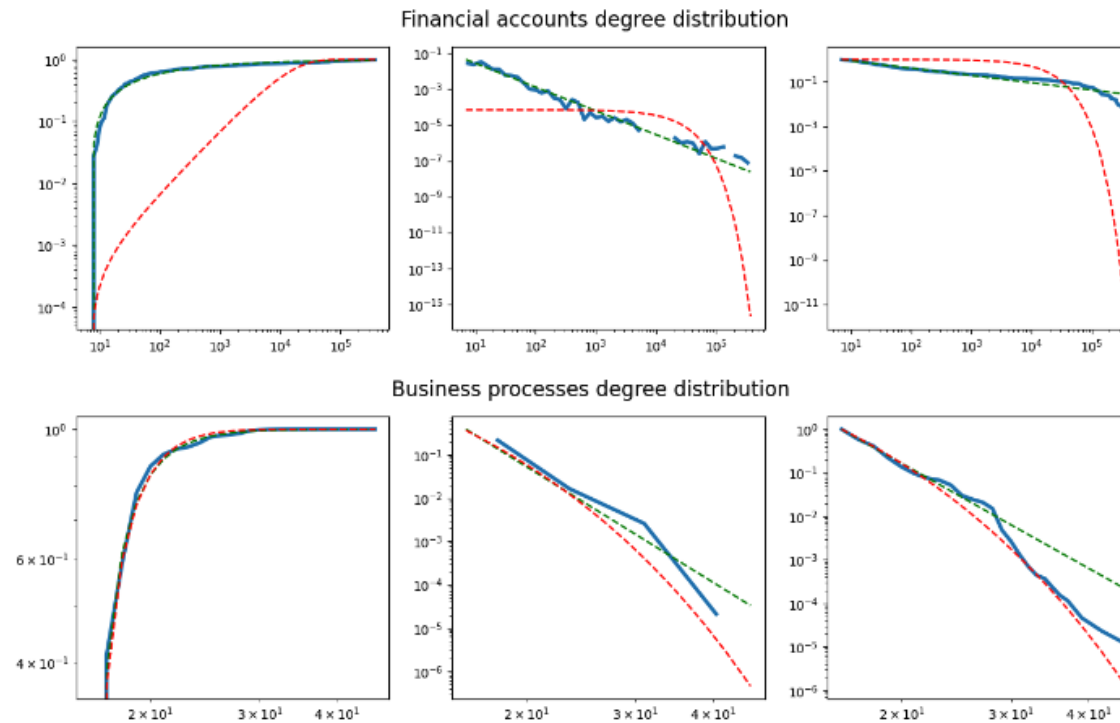

# Baseline statistics

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Baseline statistics: degree distribution

**Figure 8.** On the left is the cumulative density function, in the middle is the probability density function, and on the right is the complementary cumulative density function for financial statements network 62 (large) with 391.688 nodes in total. The top row is the financial account nodes distributions, and the bottom row is the business process nodes distributions. The green dashed line is a power-law distribution, the red dashed line is an exponential distribution, and the solid blue line is the empirical distribution. Note that the axes are on a log scale.

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Analysis: what are important parts of the financial system?

## Financial

- hubs
- gatekeepers
- core-activities

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Results and conclusion

- Number of business process nodes determines the size
- An increase in the number of nodes does not result in a corresponding proportional increase in the network's diameter
- we found evidence of a heavy-tailed degree distribution in financial account nodes, leading to hubs of interest to auditors
- Results confirm, for a small sample, that the centrality measures highlight important hubs in the financial structure, increasing the auditor's understanding of the company.

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Audit insights

## Baseline statistics:

- used to assess whether a new client's financial structure is in line with expected statistics (power-law distribution of financial account nodes, diameter expectations, etc).

## Centrality measures

- Financial Gatekeepers (betweenness centrality)
- Financial Hubs (closeness centrality)
- Financial Core-activities (degree centrality)

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Semi-supervised Anomaly Detection with Granger Causal Explanations for Financial Networks

We propose a semi-supervised graph neural network (GNN) that learns to flag fraudulent items based on limited labeled and unlabelled data points. The flagged items are explained by highlighting related items in the network using Granger causality. We use a real-world dataset, Elliptic++, based on Bitcoin transactions, to demonstrate the algorithm. We show that we obtain high-performance scores, but more importantly, we provide causal explanations for identified fraud based on graph structure. This capability can help auditors thoroughly investigate the implicated group and its interactions, offering a comprehensive understanding of the anomalies.

Visualization of the bipartite Elliptic++ graph

Nguyen et al. 2024 (work in progress)

Network  
coarse-  
graining

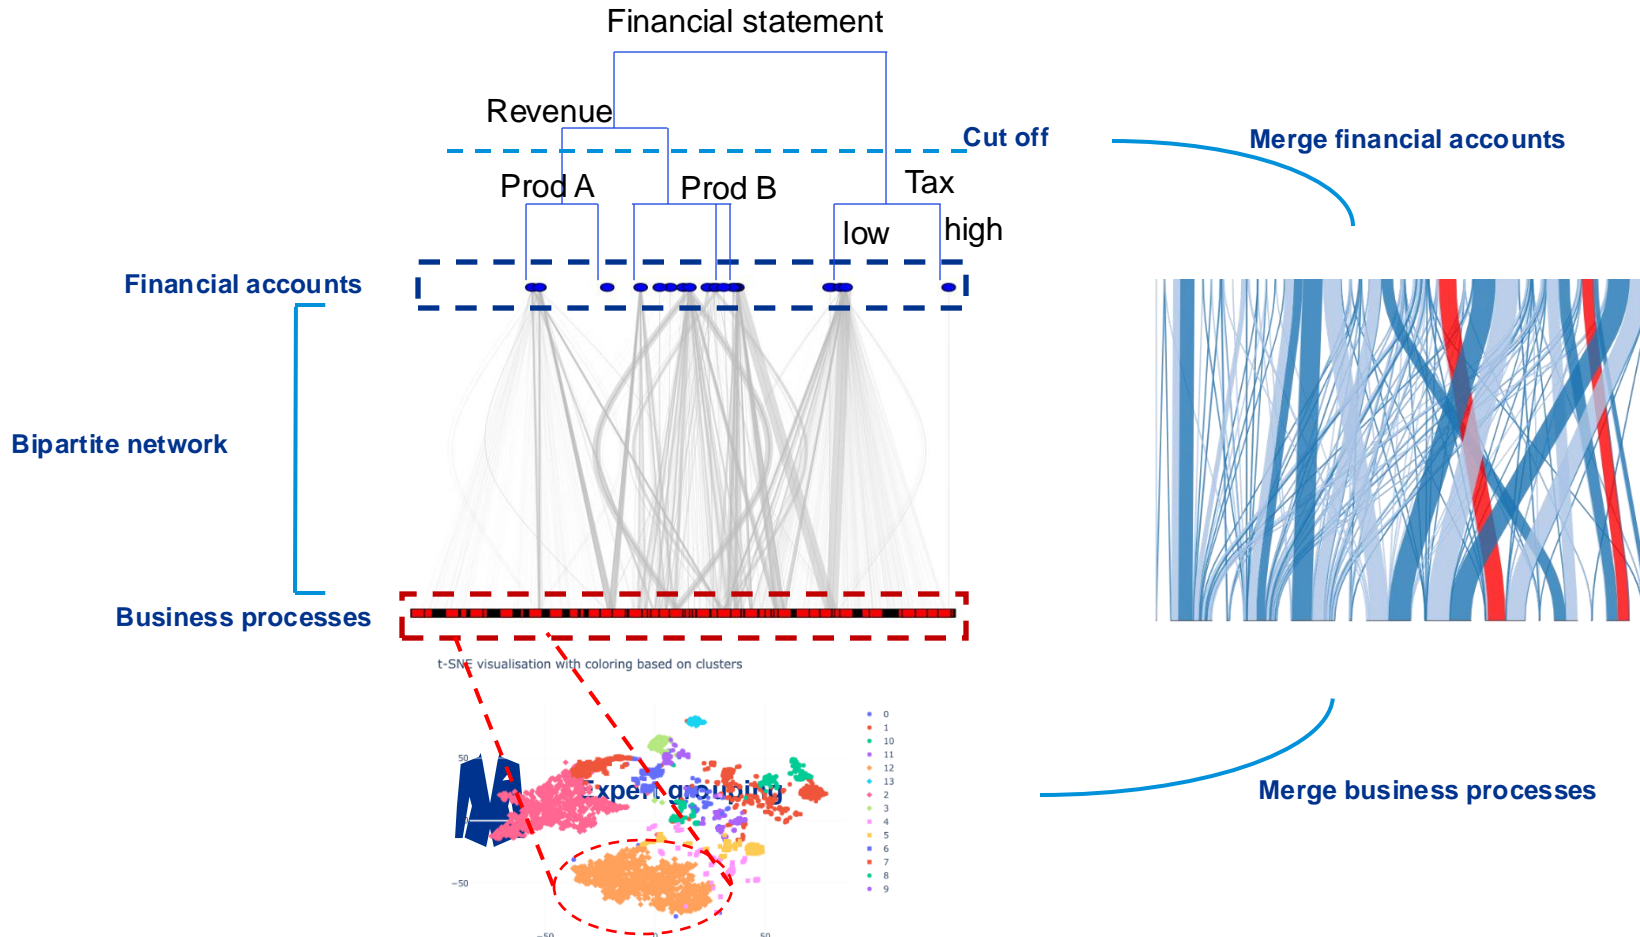

# Network coarse graining

**Motivation:** Simplify the detailed networks to provide a high-level overview of the financial structure

**Results:** We found an effective way to coarse-grain the network of detailed financial statements. The method we proposed groups the nodes in the network in an automated way; the resulting groups show a high resemblance with the groups annotated by an auditor. We resolved the detailed financial statements network limitation, a manual coarse-graining procedure. In addition, the derived node embeddings can be hierarchically ordered, a valuable property in case the auditor wants to adjust the granularity of the high-level representation. The auditor can use this property to dynamically explore a client's financial structure.

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Simplifying the network

# Network similarity

# Network similarity

**Motivation:** Measure cross-sectoral structural similarities from financial networks

**Results:** Our approach is based on the analysis of 300+ real transaction datasets that provide auditors with relevant insights. We detect significant changes in bookkeeping structure and the similarity between clients. For various tasks, we obtain good classification accuracy. Moreover, closely related companies are near in the embedding space while different industries are further apart suggesting that the measure captures relevant aspects.

# Financial statement networks

# Outlook and discussion

## Contributions

- A generic network representation of transaction data
- Base line statistics of Financial statements network
- A way to coarse-grain the network to provide a high-level understanding of the financial flows
- Similarities across companies

**Conclusion:** Our research focuses on developing data-driven audit methods to enhance the overall quality of audits. We achieved this by revealing the financial structure as a bipartite network. We answered multiple relevant audit questions by analyzing the network structure, demonstrating the chosen representation's usefulness. We showed that the financial statements network could be applied to risk assessment procedures.

## Outlook:

- Financial statements network for fraud analysis in audit
- Assurance from models

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.

# Data driven audits – paving the way for higher quality

The information contained herein is of a general nature and is not intended to address the specific circumstances of any particular individual or entity. The views expressed here are their personal views and do not necessarily reflect the position of their employer.
